

Custom Bleaching Trays From WhiteRock™ Dental Lab

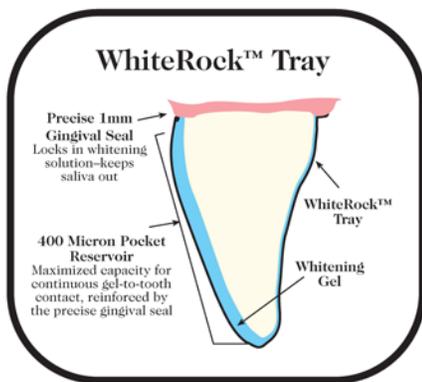

WhiteRock™ Dental Lab delivers a custom-fabricated bleaching tray that enhances the results of any whitening procedure and works in tandem with *your* preferred whitening materials to intensify end results!

To achieve the ideal environment for whitening, our lab-produced tray focuses on two critical design features: **400 Micron Deep Gel Pockets** and a **Precise 1mm Gingival Seal**. To effectively permeate tooth enamel, a bleaching tray **MUST** have the capacity to hold and lock in whitening solution to allow for constant contact with each facial surface while keeping saliva out. A precise lab-produced tray with these added features is key to successful whitening – no matter how challenging the case!

Let your professional staff focus on what really matters the most – patient care. Let WhiteRock Dental Lab support you with delivering the whiter smile your patients expect from you – every time!

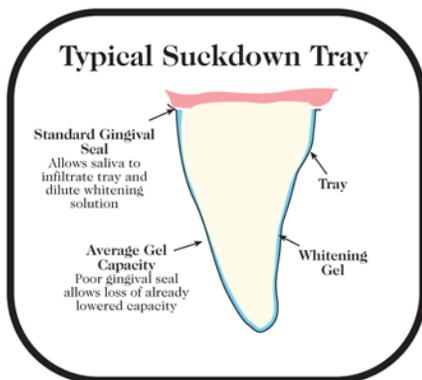

Need Better Whitening Results? The Tray is the Key!

Precise Gingival Seal

Reinforces continuous gel-to-tooth contact and ensures that the peroxide concentration is locked in to avoid saliva dilution during the bleaching process.

Deep Gel Pockets

Increased gel capacity is obtained by creating a 400 micron reservoir on each tooth facial during the modeling process to maximize continuous gel-to-tooth contact during wear.
